ContextGuard: A task-based privacy layer

A sanitisation workflow layer called ContextGuard. This is a privacy layer that safe guards the confidential information on different documents, only forwards information that is required by the next step to answer the user's question. I would like to make it as a MCP server that other agentic setups can call.

PaperLens - AI Powered Research Producer

Paper Lens automatically validates research claims by extracting code repos from PDFs, using an LLM to propose and iteratively debug evaluation commands (with up to 5 retries), and verifying reproduced metrics against paper claims—all displayed in a real-time dashboard with claimed vs. reproduced comparison bullets.

Your team average is lying to you

A live group assessment for psychological safety (Edmondson, 7 items, 60 seconds). Everyone in the room can join by QR, no signup. The screen shows the distribution, not just the mean: two teams with the same average of 4.0 can be a calm team or a split one, and only the spread tells you which. Open question I am still chewing on: the scale asks about "this team", but a room of strangers is not a team. Come tell me how you would frame that.

KiaroTools

PHP 8, SQLite, Claude Code. No frameworks, no build step.

Sales Automation Pipeline

Sales Automation Platform is an AI-powered assistant that handles the busywork of sales outreach — email, scheduling, and LinkedIn — through natural conversation, so reps can focus on selling instead of admin. Under the hood, a LangGraph-powered agent backend (FastAPI) maintains stateful, memory-aware conversations per user, streams responses in real time to a polished React chat UI, and executes real actions through connected tools: sending/replying to Gmail threads, creating and managing Google Calendar events, and automating LinkedIn outreach via browser automation — all orchestrated through n8n workflows. It supports both a general-purpose chat agent and specialized agents scoped to email, calendar, and LinkedIn tasks, with human-in-the-loop checkpoints for anything that needs approval before it goes out. The result: a single conversational interface where a sales rep can say "follow up with the Acme thread and grab 30 minutes with them next week" and the system finds the thread, drafts the reply, checks calendar availability, and books the meeting — with full visibility and control at each step.

cooldown: resilience app

On my own initiative, I've continued developing a prototype from last Claude Build Night Nuremberg for a resilience app, which I'm still fine-tuning. I developed the prototype out of the blue—I haven't conducted any user research or testing yet, and the design still closely resembles Claude's. My goal is for the app to eventually be released on the App Store and, in particular, to help employees in the tech industry who have to cope with massive changes and high pressure. I feel like I still have a long way to go, but I've made a start. <3

gamified SRS learning site to build a community

I built a gamified SRS learning site to build a community of users that will benefit from learning German and networking. Users will receive job offers and discounts depending on their use of the platform, but most importantly, gamification will keep them engaged and coming back to the app.
